

# Mod for ATS25 manual set volume on Speaker.

- By IU4ALH

It's a very simple modification to do.

You have two options -

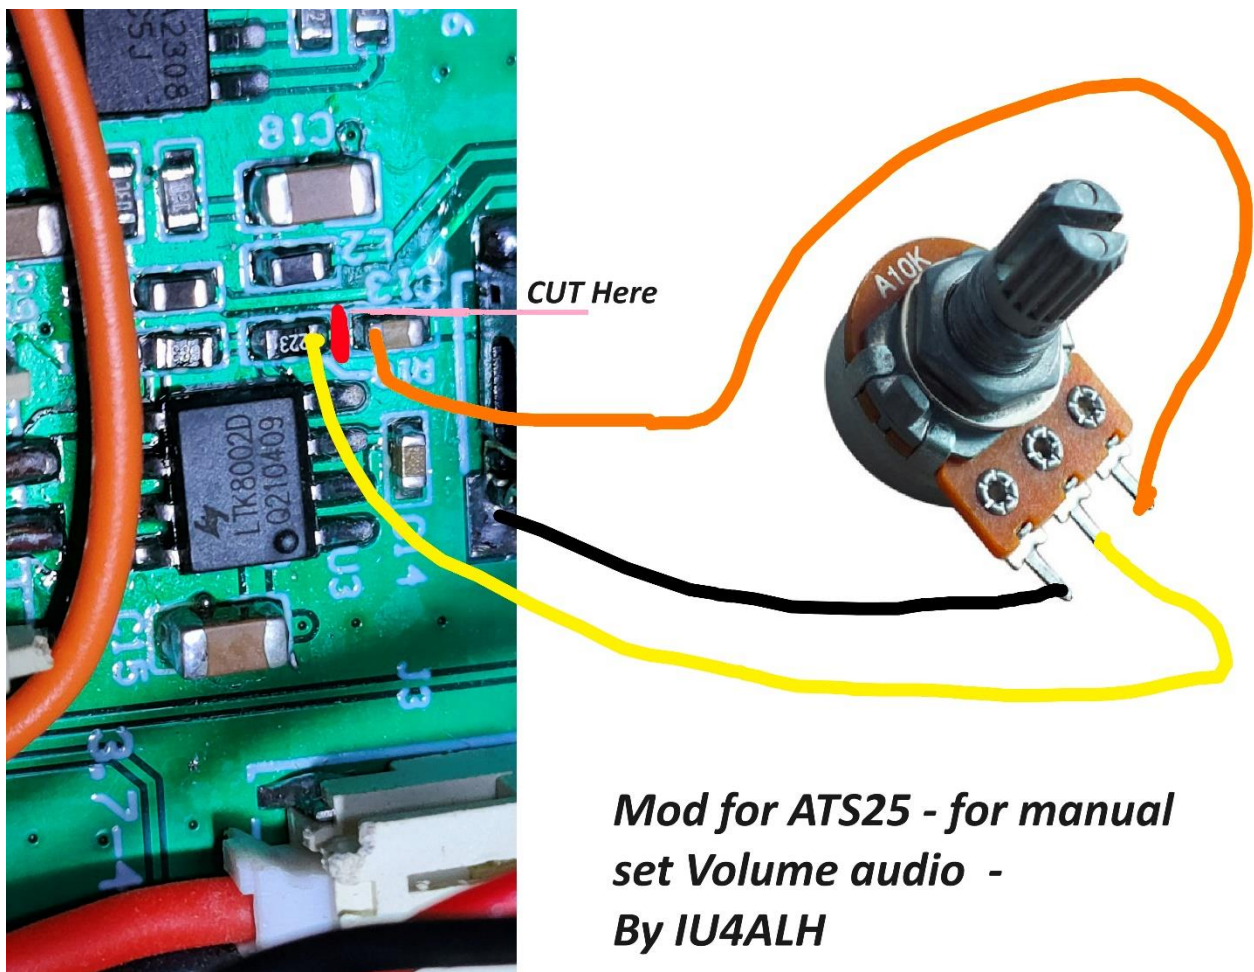

1) a fairly simple one, with a small cut on the PCB and soldering wires on SMD components, but very performing. ( Schem1 );

2) another very simple one, intervening only on the red wire of the speaker, but less performing -( Schem2 );

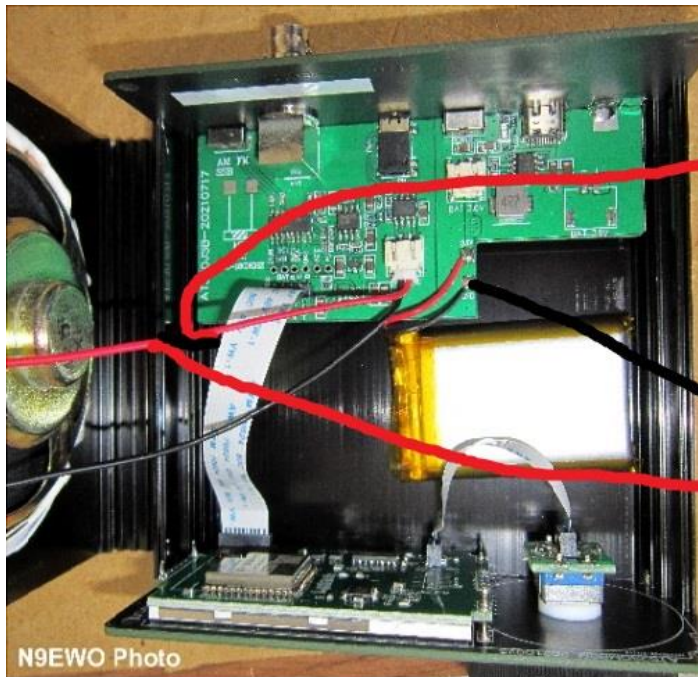

With the first modification, the volume adjustment is more "linear" and soft.

With the second modification, the volume adjustment is more "hard", but effective;

Schem1.

Schem2.

The volume potentiometer can be placed wherever is most convenient for you. Consider that there is not enough space on the front, so it must be placed either on the rear panel, or on the side of the aluminum container .... and ..... do not forget to put a suitable knob !!!
